

# Document made available under the Patent Cooperation Treaty (PCT)

International application number: PCT/US05/006788

International filing date: 03 March 2005 (03.03.2005)

Document type: Certified copy of priority document

Document details: Country/Office: US  
Number: 60/549,942  
Filing date: 05 March 2004 (05.03.2004)

Date of receipt at the International Bureau: 18 April 2005 (18.04.2005)

Remark: Priority document submitted or transmitted to the International Bureau in compliance with Rule 17.1(a) or (b)

World Intellectual Property Organization (WIPO) - Geneva, Switzerland  
Organisation Mondiale de la Propriété Intellectuelle (OMPI) - Genève, Suisse

## USE ONLY FOR FILING A PROVISIONAL APPLICATION FOR PATENT

This collection of information is required by 37 CFR 1.51. The information is used by the public to file (and by the PTO to process) a provisional application. Confidentiality is governed by 35 U.S.C. 122 and 37 CFR 1.14. This collection is estimated to take 8 hours to complete, including gathering, preparing, and submitting the complete provisional application to the PTO. Time will vary depending upon the individual case. Any comments on the amount of time you require to complete this form and/or suggestions for reducing this burden, should be sent to the Chief Information Officer, U.S. Patent and Trademark Office, U.S. Department of Commerce, P.O. Box 1450, Alexandria, VA 22313-1450. DO NOT SEND FEES OR COMPLETED FORMS TO THIS ADDRESS. SEND TO: Mail Stop Provisional Application, Commissioner for Patents, P.O. Box 1450, Alexandria, VA 22313-1450.

If you need assistance in completing the form, call 1-800-PTO-9199 and select option 2.

P19SMALL/REV05

## HARDWARE ABSTRACTION OF MIDDLEWARE

This is a specific way of implementing middleware such that hardware outside a general-purpose processor can be directly connected through middleware

In the implementation of SCA (software communications architecture)-compliant software-defined-radio (SDR), a military standard, data channels are necessarily directed through CORBA, which resides on the system's general-purpose processor (GPP). Because of this feature, when two different resources in this architecture are connected, regardless of what platform they happen to be implemented on, the GPP must receive, process, and re-transmit all data passed between different resources (see Figure 1). This process can be very taxing on the computing platform. The concept shown in this disclosure is the extension of the CORBA ORB outside the scope of the GPP using a hardware switch matrix, allowing different hardware components of the SDR to communicate directly, greatly increasing the efficiency of the implementation (see Figure 2).

The switch matrix is a custom fabric that is used for the connection of multiple devices within a core or set of cores. By integrating the switch matrix into the middleware, the switch matrix now becomes an integral channel for communication.

5. What is the existing technology/art to which you are comparing?

Middleware implementations are based on centralized channel control. In this case, generic middleware (like CORBA), is developed to support not only software object portability, but also embedded hardware portability.

6. How does your INVENTION differ from present technology, what problems does it solve, or what advantages does it possess? (This should be written so someone skilled in the art can understand it.)

It significantly reduces the overhead inherent to the implementation of middleware in an embedded environment, making it possible to create a lightweight ORB that is fully compliant with the SCA v 2.2. There are several other benefits, including:

- High level of scalability, since the GPP bottleneck is greatly reduced.
- Easy upgrade path
  - Relatively easy to add new devices and swap the operating devices
- Complements refined software radio design methodology
  - Easy partitioning of functionality
- Easier integration of reconfigurable computing platforms
  - Allows the direct connection of different platforms with little GPP overhead
  - Isolates reconfigurable computing modules
  - Eases integration of different reconfigurable computing platforms
- Extension of middleware connections outside GPP allows for efficient embodiment of customized connectivity approaches (switching fabrics)
- Eases restrictions required to support power management
- Eases integration of ASICs cores into system design
- Eases development

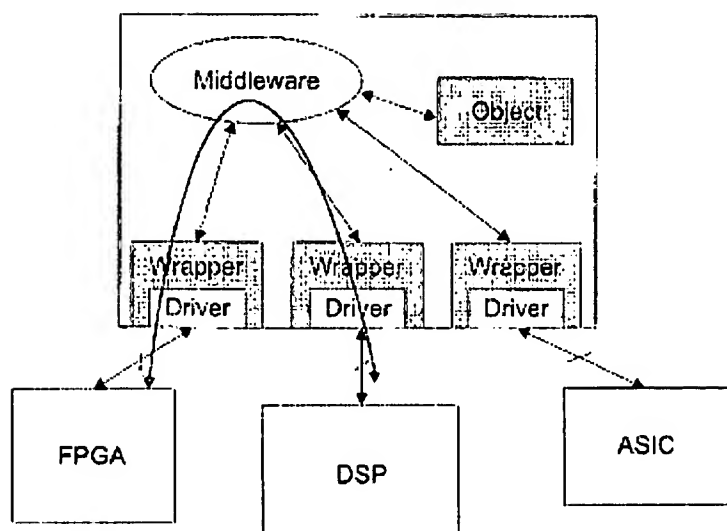

Figure 1 – Messages handled by middleware in GPP

Figure 2 – Extraction of middleware functionality outside of GPP
